

Give old roads new life in no time.

Invigorate[®]

Invigorate[®] sealcoat is an anti-aging surface treatment that extends the service life of low-volume roads with minimal traffic disruption. This sealcoat takes an active role in the absorption process — penetrating pavement 4x deeper than the typical topical — and makes it possible to reopen roads within 2 hours of application.

Reverse the effects of aging at the molecular level.

Rejuvenate binder throughout the top inch of pavement.

Combats formation of cracking into the future.

Leaves no impact on road markings.

Allows roads to reopen within one hour.

Beneath the surface.

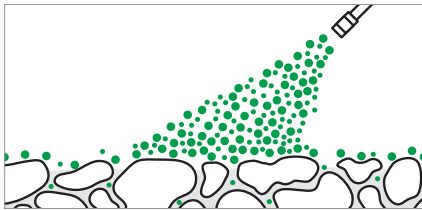

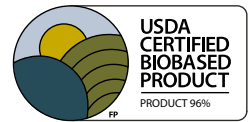

Invigorate is a waterborne, soybean-based sealcoat for parking lots, city streets and low-volume highways.

Unlike the typical topical, which only sits on the surface, this sealcoat is formulated with particles small enough to travel deeper into the pavement.

The particles are also engineered to seek out aged asphalt molecules, so the de-aging of the pavement can happen quickly and comprehensively.

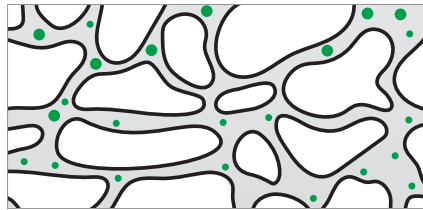

THE RESTORATION PROCESS

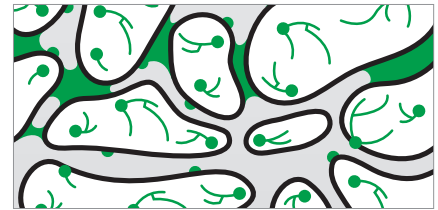

STEP 1

When Invigorate is applied to the pavement, the micron-sized particles within the treatment activate to drive the absorption process.

STEP 2

The micron-sized particles readily travel through the skeleton of the surface course, and into the pore structure of the pavement.

STEP 3

The micron-sized particles are engineered to seek out damaged sites on asphalt molecules. Once attached, the two create a reaction that reverses the effects of aging and oxidation.
